Ade (25)

"I went to Los Angeles and wanted a "Hollywood" smile. I did a lot of research and finally opted for the Incognito appliance. I always wanted to become a television reporter and for such a job, good teeth and a nice smile are of great importance."

"I wanted to get my teeth properly aligned but not with braces everyone could see, especially not at my age. Now I wear the Incognito appliance on the inner side of my teeth, hence they are invisible from the outside."

Alyson

Franziska (13)

"I was hoping that the Incognito appliance would close the gaps between my teeth so that I could laugh again. At the beginning it was unusual but after some days I got used to it. Shortly afterwards I could see the first improvements. My friends think it is cool that one can wear braces from the inside and were amazed how quickly the gaps between my teeth closed."

"I decided to wear the Incognito appliance and I am so happy with this decision. After my graduation from college it was particularly important to me to have a professional appearance and to achieve this whilst feeling confident. With conventional braces this would not have been possible. I am much more self-confident with Incognito and glad that I can smile again."

An aesthetic smile at any age with Incognito – the invisible appliance

- Incognito is a fixed orthodontic appliance placed on the inside of the teeth. It is completely invisible from the outside.
- The patented manufacturing process guarantees a remarkable flat design and as a result offers maximum comfort to the patient.
- Only with fixed orthodontic appliances can you achieve reliable results in the treatment of any kind of malocclusion.
- Fixed lingual appliances have been proven to be safer for the teeth as the inner side of the tooth is more resistant to decalcification. This is a vital aspect in the orthodontic treatment of children.

With the combination of high-grade materials and individual design, the ultra flat Incognito brackets guarantee maximum patient comfort.

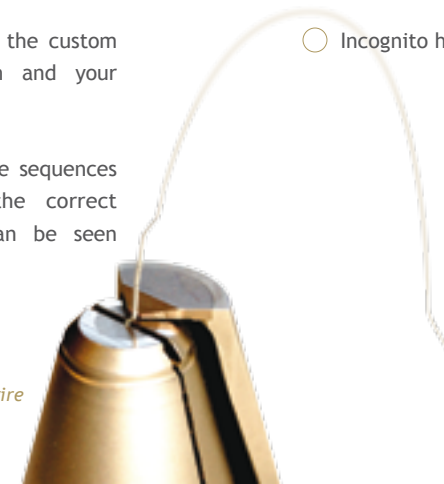

Brackets are bonded with a special dental bonding agent to the teeth (see photo). The perfect three dimensional changes to the position of the teeth, is brought about by individualised archwires, which are fabricated by a special computer-guided wire bending robot.

The “making of” your new smile

- Together with your orthodontist you will discuss and define the treatment plan. Silicone impressions will then be taken of your upper and lower jaw.
- The European based high-tech laboratory TOP-Service, the leading manufacturer of lingual braces, will then design your individual brace to create your perfect smile.
- Your custom made Incognito appliance will be manufactured with the latest state of the art CAD/CAM technology.
- Each gold alloy bracket (anti-allergic) will be manufactured using the latest rapid prototyping machines, the archwires are precisely made by wire-bending robots.
- Your orthodontist will then bond the custom made appliance to your teeth and your treatment will begin.
- Step by step the precise archwire sequences will bring your teeth into the correct position. First improvements can be seen shortly afterwards.
